Typography is a fundamental part of a template, providing you with the tools to characterise your content and bring it to life. There is a vast array of typography available with this template, as is with our previous releases, from list styles, notice blocks and a diverse number of other elements.

There are 2 methods in which to implement the typography into your Joomla content:

- [HTML Mode](#): This is the *traditional* approach for implementing typography as used in the pre-2009 templates / demos, where you had to use HTML coding / syntax for the typography. This presents two main problems: the Joomla WYSIWYG editor is notorious for stripping out HTML so could easily remove your formatted article and no typography; secondly, using HTML for typography may present a problem for certain users who are unaccustomed to HTML and coding.

- [RokCandy Mode](#): The RokCandy component from RocketTheme allows you to implement typography easily, without fear of the WYSIWYG editor ruining your formatting and allows you, and/or your clients to add them to your content with ease. This is through a method similar to BBcode (as seen in a forum). WYSIWYG friendly syntax can be used, or even custom configured that will transform a set snippet to the correct HTML when it is parsed by Joomla.

Why use RokCandy?

RokCandy is the ideal solution for those with **limited coding skills** or those who implement our templates for their **clients**. It is free from the WYSIWYG editors horrific filtering habits and can be easily pre-configured for your personal needs or the needs of your client.

[RokCandy Typography](#)

RokCandy Example

The RokCandy Typography button is created by using the following syntax with RokCandy:

```
[readon url="/typography/rokcandy-examples"]RokCandy Typography[/readon]
```

However, if we were to use HTML, the following code would be required:

```
<p> <a class=&quot;readon&quot; href=&quot;/typography/rokcandy-examples&quot;>  
<span>Read more...</span> </a> </p>
```

As you can see, the RokCandy version is a lot easier to use.
